Appendix

To create this model loader, I needed to learn a lot and get support from many sources. Most notably, [LearnOpenGL](#) by Joey De Vries was a big support. I also watched many tutorials, including math tutorials because there is a fair amount of linear algebra that I hadn't taken in school yet. [3Blue1Brown](#) has a great series on linear algebra that helped me understand the true purpose of vectors and matrices.

In addition to this, there are many libraries made to help specifically with these kinds of projects. Many libraries were used, but some like GLM, GLFW, Assimp, and OpenGL were the biggest. These allowed me to create cross-platform windows easily, create and apply math principles and this model loader in general.

For the development of the project, I used many resources such as the [Learn OpenGL Github repository](#) that helped me write the source code, as this stuff is very sensitive to typo's, and you won't get a helpful error message either.
